

HC I& UX

HCI refers to the study of how people interact with technology, while UX focuses on a user's experience with a product or system. Both fields are closely related, as HCI is used to develop products and systems that provide a good user experience.

The distinctive difference between HCI and UX is that HCI focuses on the physical interaction between people and technology, while UX focuses on the user's emotional and mental experience when using the product or system. HCI focuses on how users interact with devices and systems, while UX focuses on how users feel and perceive when they interact with them.

A good example of a "UX feature" that can be incorporated is usability. Usability refers to how easily users can use a product or system to achieve their goals. One useful feature that can be included in your design is intuitive navigation that makes it easy for users to find what they are looking for in a product or system.
